Description: The audio player's GUI is a bit confusing at first sight, but it will become more familiar with use. First of all, I would like to say that while I do appreciate this app, I think it's easy to design an audio player as it is by modifying the default player by simply adding buttons and UI elements and it's no brainer when there are so many apps doing the same thing. My objection with this app is that is too easy to be able to use the app from a player that looks the same on almost all devices and there is no effort to provide a unique UI for a custom look. To make matters worse, the design and the app is based on metaphors that are not suitable for audiophile use. Using JUKE Using JUKE's features, you can add audio, music and video files to a specific folder on your device. You can also add playlists with a custom order. To play an audio, music or video file, just touch the file to start it. Audio files can be played in the following ways: - Audio file is added and displayed in the main window - Audio file is displayed in the main window and the app automatically starts playing the file - Audio file is added and displayed in the main window, then the application is minimized (to tray) and the file starts playing - Audio file is added to a playlist, and the app starts playing the playlist's contents - Audio file is added to a playlist, then the application is minimized to the tray and the playlist starts playing Additionally, you can show audio files in a list, in a grid or in a folder. One of the most important features is the option to sort the list by folders, title or date added. You can also filter the list by songs, albums or artists. During playback, you can pause, play, stop, go forward or back, or resume from a previous position. Additionally, JUKE allows to change the audio volume, track or file type. Furthermore, you can organize your list into playlists, assign a name to each playlist, and select the playlist order. If you want to change an audio file's parameters, you can do it by hand or using a slider. You can also remove an audio file, create or remove a playlist, or edit a playlist. You can also edit metadata by touching the "Edit info" button in the file list.
