Yep, check these settings out: I am a school teacher. Over the years, I have taken the time to learn to take great shots. My settings are the same plus I have removed the noise reduction and sharpness because I like to move more in the raw world. I would also recommend compiling your images into a single.pto Tiff, and sharpen the images. Once your images are sharp, resize them and save as.jpg, as resizing them in PP or LR can do some unexpected things when you are looking at them on the screen. Good Luck! I have the same question...it may be that there is something a little

bit better to be done. I have now tried the following procedure, as suggested in a couple of forums. The old photos I have not used yet (some I have not even taken yet). No change whatever has happened. Thanks for the response. One other question, if I resize the jpg to the size that the images were photographed at when I used the smart collector for the snapshots, does that mean that I will lose that information in the raw file? When you say make sure to master your images before you start editing, do you mean we should master them in PP and LR? Or we should master them in PP then use LR to loop adjustments. What is the best workflow. Here is my workflow. I have been told that Adobe Lightroom cuts off "data" (or, the straight lines that appear in the image when you shoot bracketed multiple images) when you adjust exposure. That was my reason for it. When I have finished, I edit the raw file instead of a jpg. That way, if information is missing for a whole zone, I am not editing with Adobe Lightroom.

Also, when used with an external camera, Lightroom can optimize the settings for compatibility with the camera that captures the image. The color and exposure-related properties of each area of the image can be changed or adjusted. The adjustment tools within Lightroom can also be used to establish precise color and lighting balance across an image. The process of arranging and steering elements on your canvas can be measured in various angles of your rectangular window. For instance, you can rotate, resize, or reposition elements up or down inside your rectangular window by using the direct manipulation commands. There is also the possibility of changing the origin point of the canvas for the purpose of aligning elements. A canvas is the window where you are working, and it is a vector element.
