Through its friendly and nicely designed

The program also includes a number of settings that will enable you to change the heart rate, P wave, QRS, PR and T wave in just the way you wish. In the assessment you will be given 10 questions that will take place within 60 seconds, each with three answers that can be chosen. No matter

the score you get, you will always have an idea of how much you know about the subject of ECGs. Of course, the program has plenty of settings in which you can customize everything, so you can make your heart beat more slowly or faster than the one in the simulations. electrocardiogram displays on paper or on the monitor. Through a nice and friendly interface, this program offers a decent number of features that will help in learning how to correctly assess the results of such a test. There are many built-in presets you can opt for, which include sinus rhythm, junctional rhythm, 1st degree AV block, sinus bradycardia, supraventricular tachycardia and more. Insofar as the general preferences are concerned, unfortunately all you can

customize at this time are the background and filters. Nonetheless, there are many settings that can be modified insofar as the electrocardiogram is concerned. Thus, simECG will allow you to input the desired parameters for heart rate, P wave, QRS, PR as well as T wave. The 'Assessment' module of the utility will enable you to test your knowledge by taking a test that consists of 10 questions, each with three possible

answers of which you have to pick the correct one. After the time is up (60 seconds), you will receive the final score.
